PROFESSIONAL CONTRIBUTION

How I work.

I build the operating structure that turns complex decisions into work people can carry out.

HOW TO READ THIS

01 – 09

How I diagnose, connect, build, and improve, in general terms.

Case studies

On the portfolio site, each system shows the approach working.

Illustrations throughout are generalized. Fictional scenarios are labeled Illustrative example. No employer, vendor, or transaction details are presented.

I build the operating structure that turns complex decisions into work people can carry out

I work as a solutions architect and operator. I'm brought in when the business knows what it needs to accomplish, but the decisions, information, and ownership are spread across teams. I work out where the process is breaking down, build what's missing, and stay close enough to the work to test whether it holds up in practice.

I led the move from email-based purchasing to an integrated buying, receiving, and invoicing system. I designed eight AI workflows for procurement and property work and built backup coverage that kept essential work moving during planned leave.

HOW I WORK

WHAT PEOPLE CAN DO AFTERWARD

Decide

Facts, constraints, and decision owners are explicit, so a decision can be reconstructed.

Execute

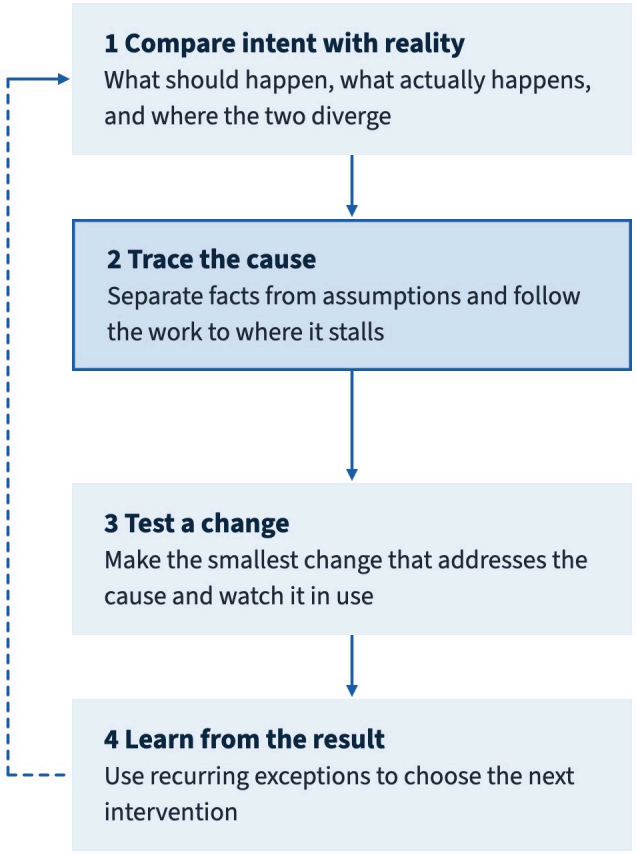

Work moves between people without losing its context.

Improve

I make recurring problems visible and leave the team with guidance and tools they can reuse.

I trace why a problem recurs before choosing the fix, then test the change against the business result

THE METHOD

ILLUSTRATIVE EXAMPLE · A RECURRING APPROVAL DELAY

Situation Approvals routinely wait for days. Reminders alone would hide the cause.

Diagnosis

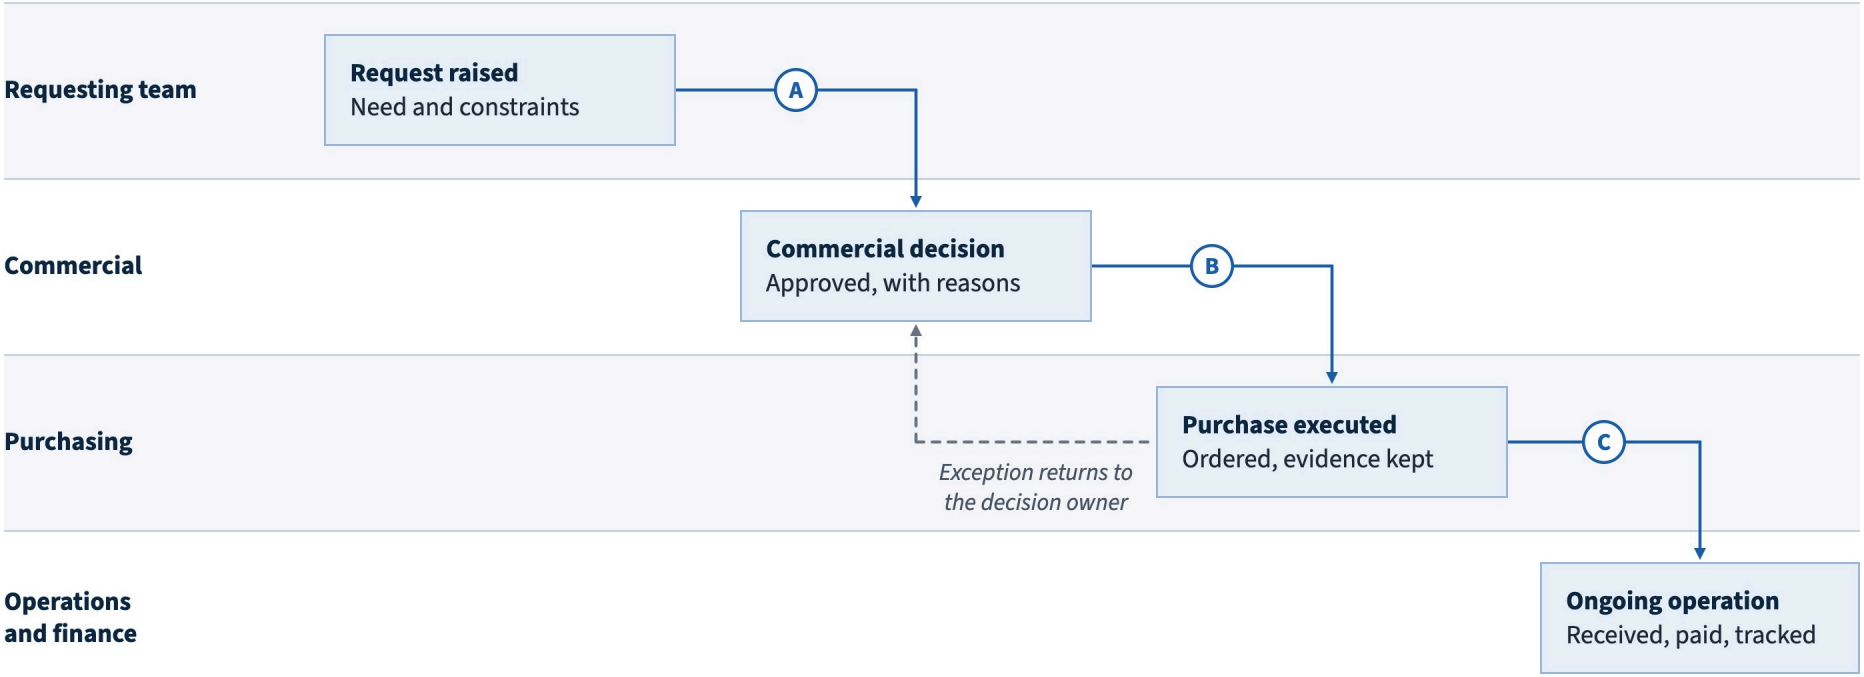

Possible cause	Evidence I look for	Fix it points to
Missing inputs	Details chased again	Required fields
Unclear owner	Work waits between teams	A named next owner
Broken routing	Wrong approver or a stall	Corrected routing

FROM PRACTICE · FIXING DATA QUALITY IN CONTRACTS AND PROCUREMENT

I traced discrepancies across source records, workflows, and system settings to find where corrections belonged. I built tools the team could use to check records and support corrections that affect day-to-day work, reporting, and connected systems.

A handoff works only when the decision, the owner, and the history travel with the work

Illustrative example: one purchasing request moving across four teams

What travels at each handoff

A · Request to decision
Need, constraints, deadline, requester

B · Decision to execution
Approval, rationale, open assumptions

C · Execution to operation
Evidence, next owner, follow-up dates

What I design

Records that carry the decision, the next owner, and the history, with exceptions routed back to whoever can resolve them.

The right structure depends on how far the work has grown, so I build what the next stage requires

STAGE	Informal	Repeatable	Scalable	Adaptive
Work intake	Requests arrive through individuals	Required facts and routing become explicit	Workflows absorb higher volume and more handoffs	Demand patterns reveal recurring friction
Decisions and controls	Approvals depend on personal knowledge	Authority, evidence, and completion standards are defined	Controls are sized to the transaction and its risk	Exceptions feed improvements to the design
Information	Context is scattered across email and files	Work history and ownership are accessible	Systems exchange reliable records and status	Measures show where behavior diverges
People and support	Experts answer recurring questions directly	Guidance and role expectations support consistency	Cross-training and self-service extend coverage	Reusable reasoning supports independent judgment
A path I led in one procurement function	**STARTING POINT** Email and individual follow-up	**DELIVERED** Structured intake, standard forms, and approvals	**DELIVERED** An integrated system for buying, receiving, and invoicing	**TOOLS BUILT** Guided research, price analysis, and negotiation prep

How I choose

1

Find the real constraint.

Often a missing decision or decision owner, not a missing system.

2

Size controls to the risk.

Speed for routine work; evidence for high-risk work.

3

Build what people can sustain.

Unmaintained structure becomes the next workaround.

Conceptual model, not a rating of any organization. Procurement path generalized from delivered work.

I translate requirements into questions, decision owners, and clear conditions for proceeding

Illustrative example: a request to share a business record outside the company

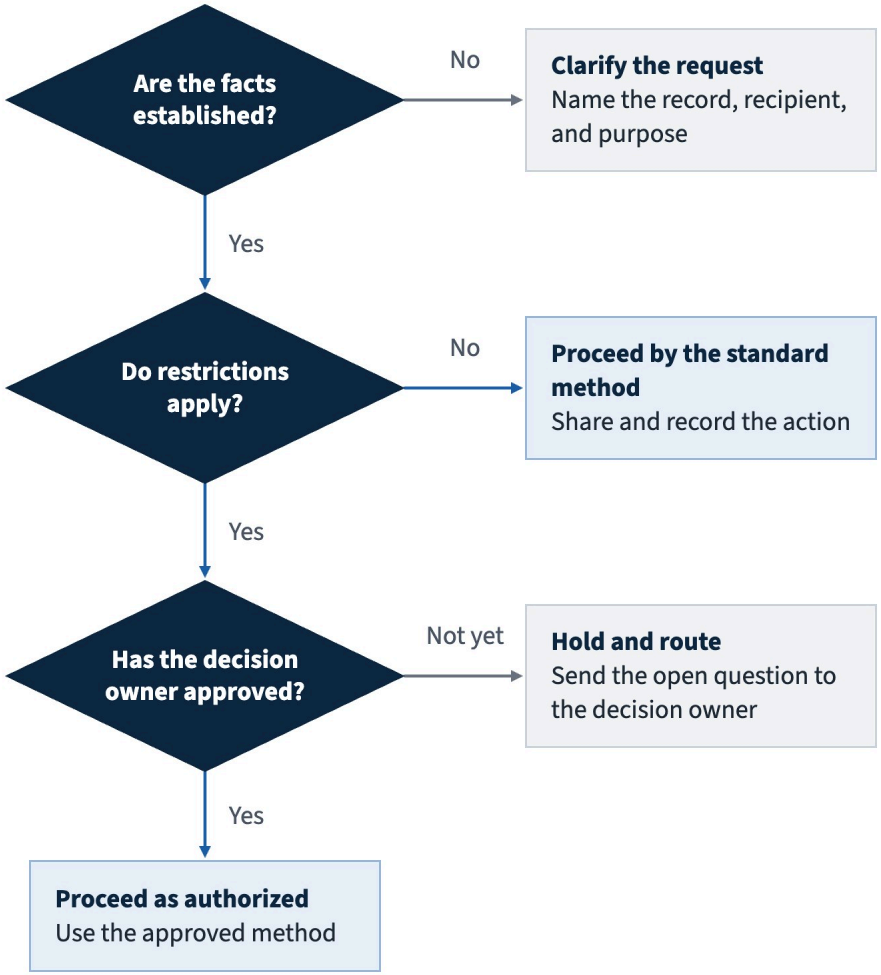

ILLUSTRATIVE EXAMPLE

"Can we send this record to an outside partner?"

Contract terms, data restrictions, and policy may apply, but none is visible from the request.

What I build

Questions, a decision owner for each condition, and the evidence needed to proceed.

Every outcome records the decision, authorization, action, and follow-up.

Facts before judgment. Deciding on incomplete facts produces a confident wrong answer.

Decision owners. Each restriction has a named person who decides.

Separate events. Asking for approval is not receiving it; an open condition holds the action.

Where I have applied it. A draft working guide for disposing of government property, built on the same gates.

AI makes specialized reasoning reusable when I define what to ask, what evidence to require, and when a person decides

Illustrative example: a team asks for help evaluating an unfamiliar software purchase

THE REQUEST

"Our team wants a new planning tool. What should we consider before we talk to vendors?"

GUIDED QUESTIONS · EXCERPT

Actual need
Who will use it, and in which roles?
Which systems must it connect to?
What happens if we change nothing?

Commercial terms
How is usage counted, and how will it grow?
What do support, renewal, and exit cost?

Evidence
Which claims come from the vendor, and which have we verified?

Hand back to the decision owner when hosting, security review, or contract terms fall outside standard limits.

SAMPLE OUTPUT

Draft for human review

Requirements summary. Shared task planning for two departments; must connect to the current document system.

Open decisions

Decision	Owner
Cloud or self-managed hosting	IT
Growth assumption behind the license count	Requesting manager
Exit and data-return terms	Contracts

Assumption shown. User counts are estimates; validate before comparing prices.

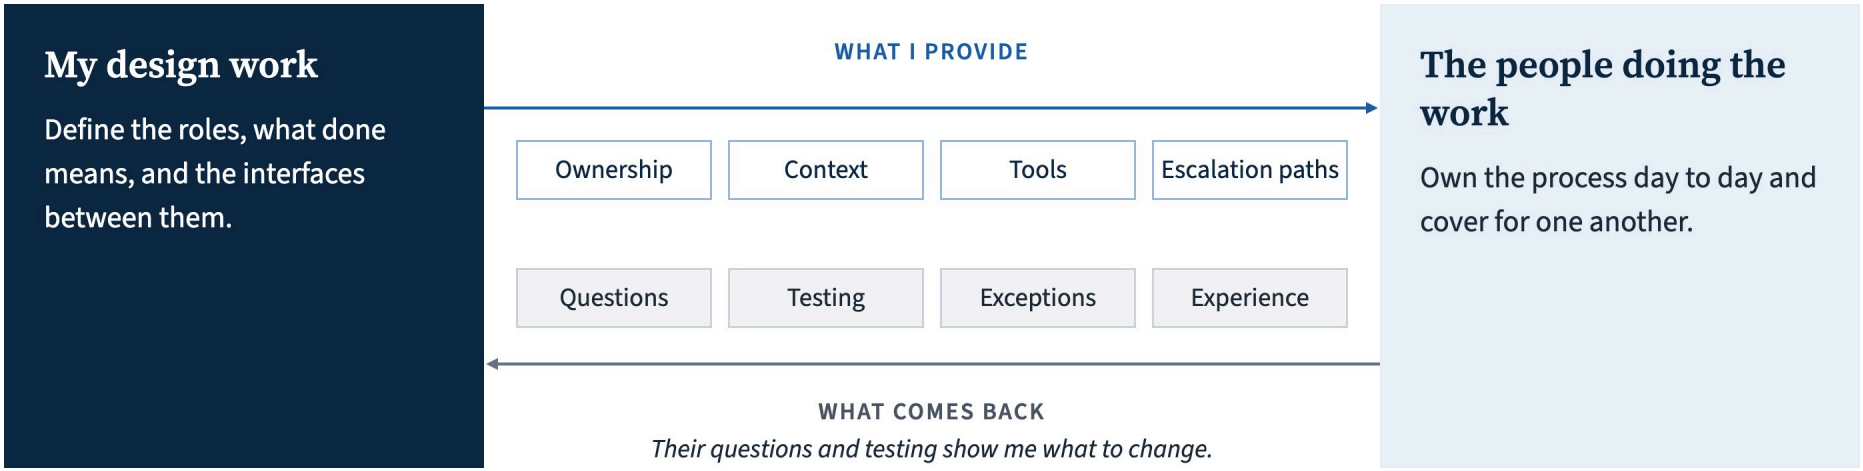

Negotiation topics. Pricing for growth, renewal limits, and data return at exit.

What I build behind the assistance

I designed guided AI workflows for eight types of procurement and property work. I build in the questions an expert would ask, the evidence a reviewer needs, and the points where a person must decide.

Illustrative example. The workflow count reflects delivered work.

I develop people to execute independently, and their questions and experience improve the design

I adapt the support to the person

I tailor assignments and coaching to how each person works, and make completion observable.

HOW I BUILD BACKUP COVERAGE · EXAMPLES FROM PRACTICE

1

Separate the work

I split a weekly systems process between two people. One prepares the files. The other uploads them and retains technical oversight.

2

Teach the judgment

I created five narrated training modules for a specialized compliance function and paired them with coaching on live cases.

3

Make coverage usable

Written procedures and accessible work histories let people pick up where someone else left off. During planned leave, the team kept essential responsibilities moving.

Examples generalized from practice. No employee details are included.

The same approach has carried across finance, enterprise change, analytics, and operational leadership

1

Finance and business systems

I built reporting and automation around how the work actually moved, so the information was useful for decisions.

2

Enterprise change

Through a business separation, contract transfers, and a merger integration, I worked to keep records, relationships, and context intact as ownership changed.

3

Analytics

I traced a failing downstream process back through its source data and built analytics to connect operational records to the decisions they supported.

4

Operational leadership

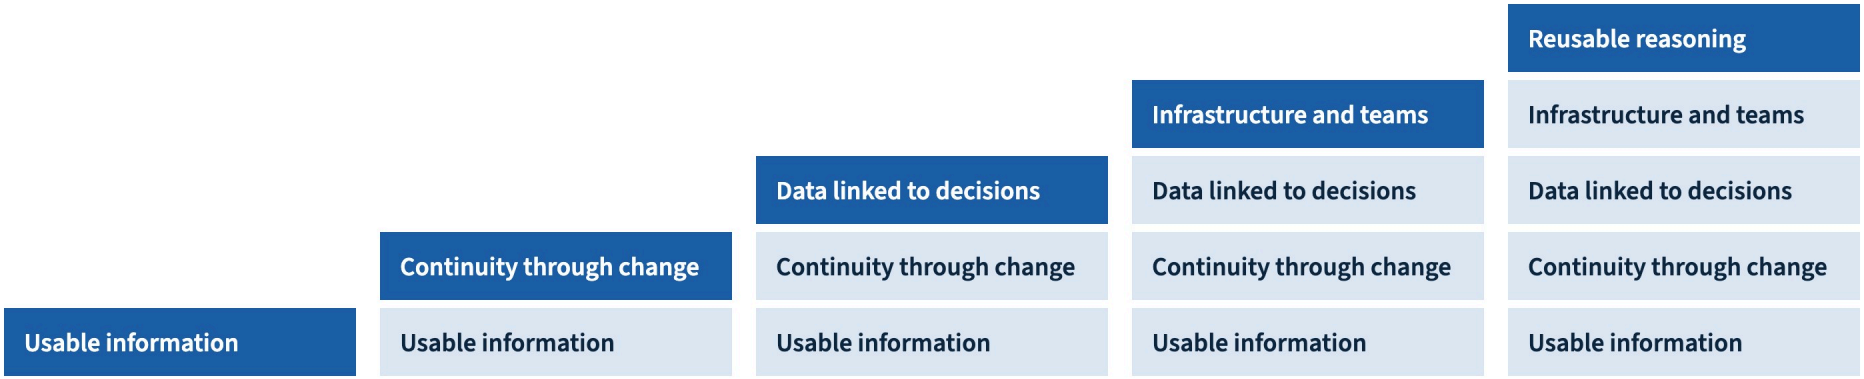

I built workflows, controls, systems, and team capability together while keeping the operation running as the business grew.

5

AI-assisted work

I turned specialized judgment into guided tools that show people what to ask, what to verify, and when a person needs to decide.

WHAT EACH PHASE ADDED TO THE PROBLEMS I CAN TAKE ON

Career phases generalized; employers and dates omitted.

I leave the organization better able to decide, execute, and improve

Each intervention changes what people can do after I step back

	WHAT I PUT IN PLACE	WHAT PEOPLE CAN DO AFTERWARD	WHERE I HAVE SEEN IT
Decide	**Recorded rationale and named decision owners**	**Reconstruct a decision** See why it was made and who can change it, without searching old email	I questioned the proposed scrap classification, checked the applicable requirements, and brought technical, commercial, and government stakeholders together to complete the acquisition.
Execute	**A shared record of daily logistics work**	**See what's done, what's blocked, and what needs to happen next.**	I introduced ticket tracking in Logistics so another team member could pick up an assignment with enough context to continue.
Improve	**A library of step-by-step guides and reusable templates**	**Follow a consistent process and adapt a standard document.**	I built the library so the property team could prepare recurring documentation from a template instead of starting from scratch.

WHERE I CONTRIBUTE MOST

I am most useful where work spans functions, systems are changing, and requirements must become practical. I define the problem, build the structure to move it forward, and leave people able to carry it on.

Examples generalized from delivered work.

PROFESSIONAL CONTRIBUTION

Problem first.
Built to scale, sustain, and perform.
Outcomes, not advisory artifacts.
